

## P2A Low Noise Floor, High Sensitivity, Wide Dynamic Range Hall Sensor

Advanced Hall Sensors Ltd. specialise in the design, development and manufacture of highly sensitive Hall sensors using AlGaAs/InGaAs/GaAs quantum well technology.

### 1 Features

- Low noise floor: 20 nT Hz<sup>-½</sup>
- High sensitivity: 160 V A<sup>-1</sup> T<sup>-1</sup>
- Wide (linear) dynamic range: 20 nT to 2 T
- Wide frequency operating range: DC to 5 MHz
- High linearity: 0.5 %
- Low temperature coefficient: -0.06 % °C<sup>-1</sup>
- Compact size: 70 × 70 μm<sup>2</sup> sensor active area

### 2 Applications

- Magnetometry
- Magnetic imaging
- Position monitoring
- Speed monitoring / tachometry
- Electrical current measurement
- Galvanic isolation

### 3 Specifications

Absolute maximum ratings		
	Rating	Unit
Biasing voltage $V_B$	6	V
Biasing current $I_B$	9	mA
Power dissipation $P_B$	54	mW
Operating temperature $T_0$	-100 to +200	°C
Storage temperature $T_1$	-100 to +200	°C
Soldering temperature $T_2$	260	°C

Electrical characteristics				
	Min	Typ.	Max	Unit
Sensitivity $K_H$	-	160	-	V A <sup>-1</sup> T <sup>-1</sup>
Resistance $R$	620	720	780	Ω
Residual ratio $\theta^A$	-7	±5	+7	%
Temperature coefficient of Hall voltage signal $\alpha^B$	-0.08	-0.06	-0.05	% °C <sup>-1</sup>
Temperature coefficient of resistance $\beta^C$	-	0.3	0.4	% °C <sup>-1</sup>
Linearity of Hall voltage signal $\gamma^D$	-	0.5	1.0	%

#### Notes:

Testing conditions			
$I_{B1}$ 1 mA	$T_1$ -100°C	$B_0$ 0 mT	$B_2$ 100 mT
$I_{B2}$ 5 mA	$T_2$ +150°C	$B_1$ 60 mT	$B_3$ 500 mT

#### A. Residual ratio

$$\theta = \frac{V_H(B_0)}{V_H(B_2)}$$

#### B. Temperature coefficient of Hall voltage signal

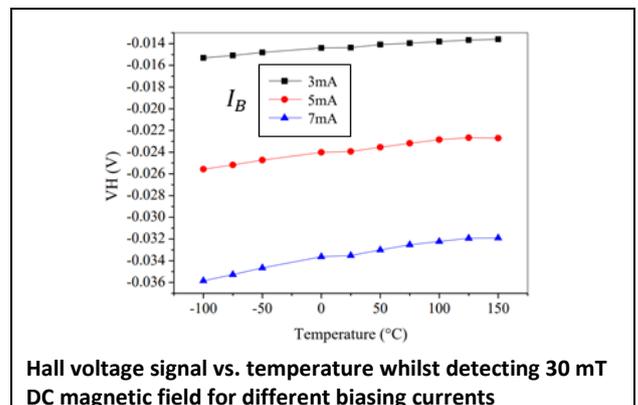

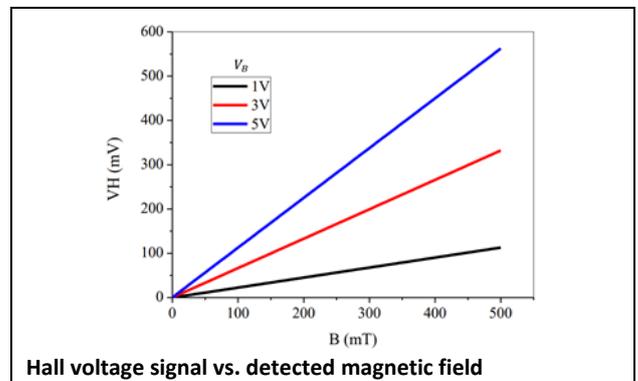

$$\alpha = \frac{1}{V_H(T_1)} \frac{V_H(T_2) - V_H(T_1)}{T_2 - T_1} \times 100$$

#### C. Temperature coefficient of resistance

$$\beta = \frac{1}{R(T_1)} \frac{R(T_2) - R(T_1)}{T_2 - T_1} \times 100$$

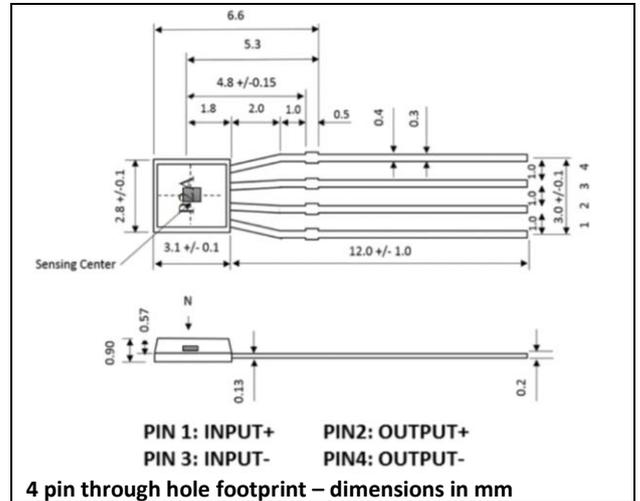

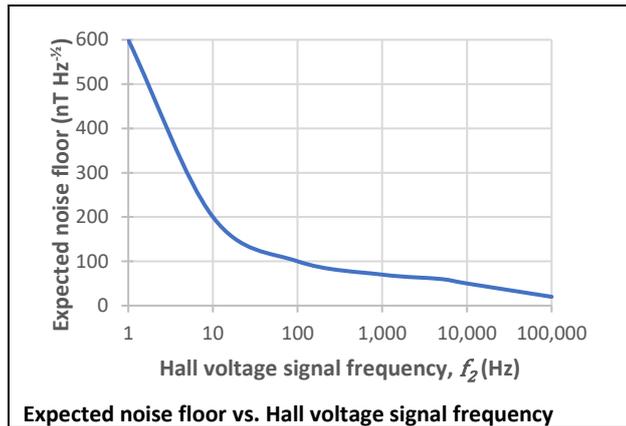

#### D. Linearity of Hall voltage signal

$$\gamma = \frac{K_H(B_3) - K_H(B_1)}{\frac{1}{2}[K_H(B_1) + K_H(B_3)]} \times 100$$

## P2A Low Noise Floor, High Sensitivity, Wide Dynamic Range Hall Sensor

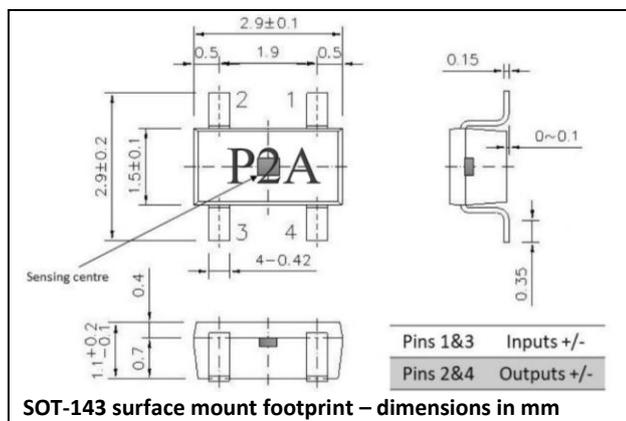

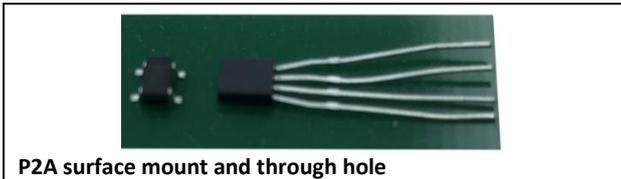

Note that the expected noise floor also includes the effects of biasing current, filtering/conditioning and ADC conversion. Please follow the recommended use guidance to achieve such performance.

### 4 Pin configuration and layout

The sensor is available in two packages:

	Package	Package size (mm <sup>2</sup> )
Surface mount	SOT-143	2.9 × 2.9
Through hole	4 pin	3.1 × 2.8

### 5 Sensor description

The P2A is a high-performance Hall sensor with a low noise floor, high sensitivity and wide dynamic and operating range. Using AlGaAs/InGaAs/GaAs technology, the P2A contains a quantum well which confines the electrons of the biasing current within a 2-Dimensional Electron Gas. From this, the electrons experience the Hall effect via a detected magnetic field in a more controlled manner with less scattering, allowing for greater measurement sensitivity and significantly reduced noise floor compared to generic Hall sensors.

The detected magnetic field can be easily reconstructed using the equation:

$$B_z = \frac{V_H \cdot R}{K_H \cdot I_B} = \frac{V_H \cdot R}{K_H \cdot V_B}$$

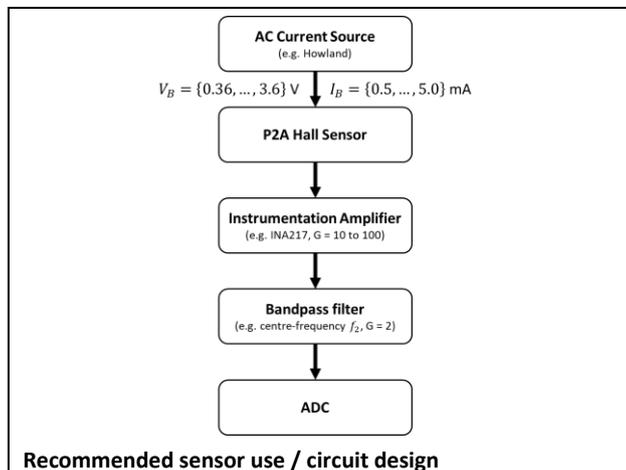

$B_z$  is the magnetic flux density detected tangential to the sensor plane (T),  $V_H$  is the Hall voltage signal (V),  $K_H$  is the P2A sensitivity (160 V A<sup>-1</sup> T<sup>-1</sup>),  $I_B$  is the biasing current used (A),  $R$  is the P2A resistance (Ω) and  $V_B$  is the biasing voltage used (V).

Users have full control over the biasing current (frequency and magnitude) which is externally provided to pins 1 and 3, or 2 and 4. This direct control enables greater versatility of the sensor, with users able to control the dynamic range and suitability of the output signal to ensure compatibility to downstream amplification, filtering and Analogue-Digital Conversion as required.

# P2A Low Noise Floor, High Sensitivity, Wide Dynamic Range Hall Sensor

## 6 Recommended use

For low noise wide dynamic range applications, it is recommended to bias the P2A Hall sensor using a low noise AC biasing current, such as that provided by a Howland current source within the range of 0.5 to 5.0 mA. It is also recommended to amplify the output Hall voltage signal using a suitable low noise, low distortion instrumentation amplifier, such as the INA217. A secondary amplification and bandpass filter stage will also help to reduce the bandwidth of the circuit and further reduce noise.

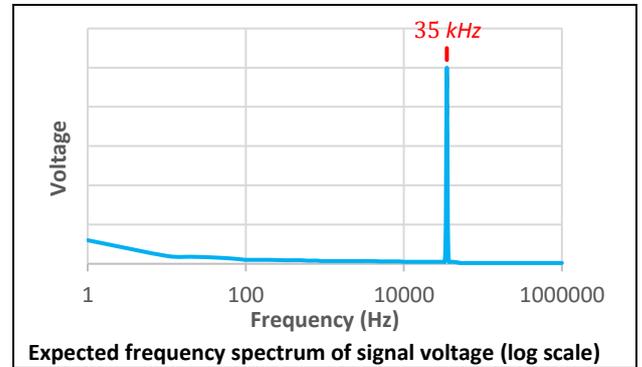

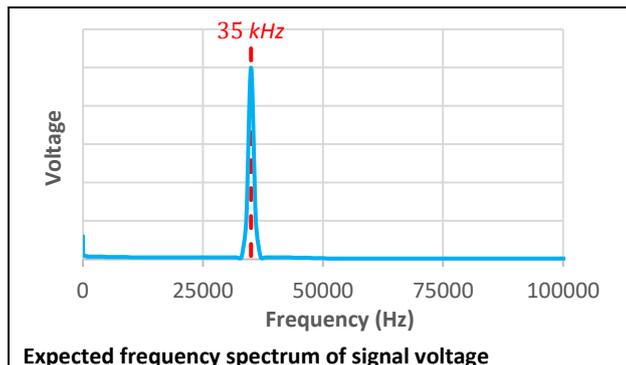

Note that the frequency and phase of the output Hall voltage is a modulated combination of both the biasing current and the detected magnetic field:

$$f_2 = \max(f_0, f_1) \pm \min(f_0, f_1)$$

$f_2$  is the frequency of the Hall voltage signal (Hz),  $f_1$  is the frequency of the biasing current (Hz),  $f_0$  is the frequency of the detected magnetic field (Hz).

e.g. Using a biasing current frequency of 35 kHz and detecting a static (DC) magnetic field:  $f_0 = 0$ ,  $f_1 = 35$  kHz and  $f_2 = 35$  kHz.

e.g. Using a biasing current frequency of 50 kHz and detecting a magnetic field of 250 kHz:  $f_0 = 50$  kHz,  $f_1 = 250$  kHz;  $f_2 = 200$  kHz and 300 kHz.
